## **PROBLEM**

(4.6) Find the probability of throwing at most 2 sixes in 6 throws of a single die.

## Solution

Let X represent the number of sixes in six throws of a dice

 $X \in \{0,1,2,3,4,5,6\}$ 

By Binomial distribution formula,

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

Here,

To find the probability of getting atmost two sixes in six throws of a single dice:

$$P(X \le 2) = P(X = 0) + P(X = 1) + P(X = 2)$$

$$P(X = 0) = {6 \choose 0} \times (\frac{1}{6})^0 \times (\frac{5}{6})^{6-0}$$

$$P(X = 1) = {6 \choose 1} \times (\frac{1}{6})^1 \times (\frac{5}{6})^{6-1}$$

$$P(X = 2) = {6 \choose 2} \times (\frac{1}{6})^2 \times (\frac{5}{6})^{6-2}$$

$$P(X \le 2) = {56 \choose 66} \times 1 + {55 \choose 66} \times 6 + {54 \choose 66} \times 15$$

$$= 0.937714$$

SymbolMeaningkno. of sixes in six throws  
of a dicenno. of throws = 6pprobablility of getting a  
six in a single throw of  
dice = 
$$\frac{1}{6}$$
